

Code Review #1

Name: Answer KeyDate: 9-10-26

Question #1 (3 points):

Which is a valid variable naming convention?

- a.) num-of-cats b.) 2ndCatName c.) isCat! **d.) is_cat_name**

Question #2 (3 points):

What is required at the top of each python code file for this class?

Name

Course

Date

Explanation of Program

Question #3 (3 points):

Write a print statement using F-strings that prints the variable, distance, to 3 decimal places.

```
distance = 23.2342763
print(f"{distance:.2f}")
```

Question #4 (3 points):

Write a program that asks a user for their favorite food and store that answer in a variable called favFood.

```
favFood = input("What is your favorite food? ")
```

Question #5 (6 points):

Complete the following code:

Formula: $Money = \frac{(Coins)^2}{4} + 2 - 2 \cdot 4$

```
#obtain user input of coins (integer)
coins = int(input("Please enter in a quantity of coins: "))

#convert coins to money
money = ((coins ** 2) / 4) + 2 - (2 * 4)

#print coins to money conversion results (formatted to 2 decimal places &
commas)
print(f"Your inputted quantity of coins is approximately ${money:.2f}")
```

Question #6 (12 points):

Objective: Write a program that takes a distance in feet and converts it to yards.

Requirements:

- Ask user for distance in feet (float)
- Must output converted distance in yards (formatted to 2 decimal places)
- Be sure to write comments explaining each step taken.

Hint: 3 feet = 1 yard

```
#obtain distance from user
feet = float(input("Enter in a distance (in feet): "))

#convert feet to yards
yards = feet / 3

#print out conversion
print(f"That is equivalent to {yards:.2f} yards.")
```
